

Tyler Rowland

I understand the desire for clean air. I also understand the economics and infrastructure isn't ready for everyone to have an EV. As California proved this September when a heat wave settled in over nearly the entire state EV charging was restricted to 12am TO 6am. To conserve grid capacity. There are 33 million people in California 6 million have an EV as there only car. EV's are great for commuters driving less than 60 miles one way to work. But in traffic, high temperatures or heavy rain an EV can lose up to a 100 miles of its established range. Not too mention there inability to start in cold weather, which Eastern Washington is known for. This has stranded many motorist in EV's throughout the US and led to 35 fatal accidents in California alone this year. As a former resident of California, EV's are not the answer. They just push the pollution from one origin to another. Also there is far less lithium in the world than oil and gas.
