

## Kenneth Smith

To call the current path of eliminating fossil fuels is insane. Those pushing the change are ignoring information and current events. Emissions are the main excuse for the immediate change. No one has shown wind and solar as reliable enough to support the power needs for 100% electric vehicles. The power grid can not support the current 1% of electric cars. California is asking people to charge their cars due to power strain on the current grid! What is being ignored is the fossil fuels needed just to mine the elements for batteries. This whole thing is a boondoggle! Stick with what works, perfect alternatives and implement over time. It is said we have 100 years of oil, just in the United States. You making the decisions probably won't be alive to see the whole thing crash. Thus leaving future generations to pick up the pieces and fix your faux pas!
