

## Flannery Wilcox

I am fully in support of this rule. We need to broaden the diversity of energy and transportation, and while there is room to improve, the point is that there will be improvement (especially by 2035).

Refusal to evolve is the reason why we are falling behind the rest of the first world countries in terms of education, healthcare systems, economy and scientific/technology standards. People who don't want to change are the same ones complaining that their family farm isn't as financially successful as it was in the 1990s. A refusal to adapt to a changing world leaves us all behind.
