

Michael Herman

This proposal is total lunacy on the part of our Governor. First, EV are no greener than any compact gas vehicle currently on the market, and if you don't know what it takes to manufacture an EV and its battery, then you're just not doing the research you need to do. Second, EV do not produce their own energy, they have to be charged by our electrical grid, which is produced about 85% of the time, by burning fossil fuels, and is overused now and in some areas not able to keep up. Third, we will need to switch over to cleaner producing methods, like Solar and Wind Turbines which are not efficient enough and can't keep up with our demands now. So, we'll need to build Nuclear Generators or Hydro-electric dams which are very expensive and will also take decades. So, start the long-term projects and build the infrastructure before outlawing our cars.
