I am TOTALLY OPPOSED to this plan!!! Not only are such cars unaffordable for most people you have not taken into account the lack of recharging stations available & the length of time it takes to recharge the average electric vehicle. And if the environment was so important to you why do you want to encourage mining of rare minerals to produce the batteries (these minerals are almost exclusively found in politically unfriendly nations like China). And, when the batteries reach the end of their lifespan, where are you going to dispose of them??? This is a short-sighted solution for a problem that doesn't exist.
