

## Charlie Tyrian

EV's are too costly. Charging stations are not readily available nor can an EV be charged in a timely manner and therefore considered not efficient to support the people. The electrical grid requirements are not presently adequate to support EV's. Solar and wind alternatives are not reliable cost-effective alternatives and therefore provide minimum support. Mining for these precious car battery minerals that we don't have in sufficient quantities for EV's will do greater catastrophic damage to our environment. Mandates always dictate a loss of freedom, therefore recommend that these initiatives be voted on by we, the people.
