

Norman Oakes

I am against prohibiting the sales of gas powered vehicles after the year 2035.

The average electric vehicle would be prohibitive (greater than 60,000). The infrastructure would cost billions and would take years to build. Electrical grid upgrades to support increases draw would also be prohibitively costly and take years to expand. Replacement of car batteries is an ongoing expense of 5,000 or more every five to ten years.

It has never been determined that global warming is only human caused. Our planet goes through many natural cycles and we are just in one of them. We need to drill our oil and use it efficiently to give our nation preeminence once again.
