

Stephanie Gallagher

This EV mandate and gasoline engine is wrong, unfair and costly. It will do nothing to curb emissions. Just to expand the power grid to bear the load of everyone charging their super expensive EV cars would be astronomical in scope and cost.

EV cars are expensive, the battery charges don't provide the distance they are supposed to, nor do the batteries last as long as they should prompting expensive battery replacements.

If EV vehicles were truly a practical and economical solution to transportation, then a free market would make it happen. Banning gasoline cars and forcing people into EV's is not the way to go. It is literally shooting the economy and the environment in the foot.
