

Val Williams

This bill proposing all Electric vehicles and the phase in period, In my opinion is short sighted and typical of Washington State Blunders. I believe a much longer time is required so that the power grid can be upgraded to accommodate the future growing needs for electric power. For example the Washington state push to demolish dams and do away with natural gas for heat and gas water heaters. Plus we will be dependent on China for providing most of the rare earth mineral for EV batteries and the production of most of new replacement EV batteries. The cost of replacement EV batteries should also be considered,

Most EV batteries will be in the \$5to \$10,000 dollar range plus another thousand for installation. Does anybody in state government have any since of reality????
