How is electricity generated? How are the batteries produced? How are the batteries disposed of? Can the power grid support this? None of these questions, when answered honestly, equate to the viability of all electric vehicles state wide. This is political theater. Perhaps a time will come when technology allows this to make environmental and economical sense. That time is not now, nor will it likely be 2035. Look at California's problem with the grid and asking people to not charge their cars.
