

Catherine Phillips

At this time, we have very low emission gas powered cars that work wonderfully. We have the capacity to be energy independent if regulations for drilling from Biden's day one executive order were reversed. We need to be careful with our resources, but our alternative energy options like solar and wind are not enough to force everyone to buy electric vehicles. Electric vehicles are not energy efficient, cost a LOT of money, do not last as long as gas powered cars, are full of toxic chemicals. When an EV catches fire in an accident, more water and toxic chemicals are needed to put out the fire. We need more research before forcing people to switch!!
Why aren't we looking into Nuclear power?!
