

## Glen Gipe

This is an unrealistic goal and is without a common sense approach. The presumption is electric cars will make our lives better. However the fact is 98% of the US electricity is generated by fossil fuel. Climate impact of mining ore for the batteries and life cycle analysis of the materials for EV's must be weighed according. Providing transitional steps must be consistent regarding hybrids and alternative forms of fuel before taking this drastic measure. Let's do this right and not knee jerk legislation without full merit analysis.
