

Peter Sweet

Have you noticed that California, having adopted a similar policy, recently asked people not to charge their electric vehicles during the recent spate of hot weather to reduce stress on the power grid? So 13 years before the goal is supposedly to be reached, the grid is already proven to be inadequate for current needs. What will happen when everyone in CA has an electric vehicle? Will charging, and hence the ability to drive, be rationed in some way?

To adopt this policy, without PROOF that the grid IS (not might be) adequate to support it, is insane. Please do not do it.
