

## John Middaugh

This a classic example of putting the cart before the horse! Enacting policies before ensuring that the infrastructure can support the demand. A better approach instead of knee-jerking would be to get all the energy czar's together and decide on where the diminishing point of return is for each energy faction, and then decide on a phased-in approach based on the impact for each sector beginning with cities and rural farming areas! In essence, you eat an elephant a little at a time!
