Our country doesn't have the infrastructure to support electric vehicles. And, just because you build the charging stations doesn't mean there will be the electricity to support the stations. After all, when you shut down the power plants (coal, natural gas, carbon based fuels, hydro), that are capable of ramping up to produce the electricity needed to power everything, all you have left is the unreliable electricity produced from solar, wind, etc. Build more Nuclear plants and maybe you can get away with mandating electric vehicles. Until then, how about not messing with something that isn't broke.
