

Dan Marsolek

I think mandatory electric cars is a rotten idea. As many other people have asked is how do they plan to supply the electric grid with enough electricity to power these vehicles. Is it going to be coal or natural gas both of which they are wanting to ban as well or are they planning on installing more of the highly in-efficient windmills or solar farms both of which will not be able to keep up and this will create black outs. They should be looking into newer technology like hydrogen powered cars or just work on making gas and diesel vehicles run cleaner. These two ideas seem more feasible since the technology advances so quickly that within ten years they would be able to perfect them if they gave those the same effort and financing that they give towards trying to develop wind and solar.
