

Daniel Crooks

EV'S are the future, but the cart before the horse mentality will never work. There's not enough wind, solar or hydro to cover all energy needs. ♦ So that leaves us with nuclear, hydrogen, natural gas and fossil fuels. We will need all of these to evolve to the next level...What about India and China??? They live off coal...China is about to put 5 additional coal fired power plants online in the near future ...Penalizing the hard working middle class in the USA is wrong. Climate change is all part of evolution and God's will....Get a grip liberal progressives.....
