

James Grover

there is not enough electrical grid sources to support ev electric cars. Even CEO of toyota says this 2035 change won't work, perhaps by 2060 if we start now building 4 gen nuclear plants to create more engergy. Solar and wind will not come close to make this work and with the negative emphasis on oil, we are doomed if we don't use our brains and realize this is a 40-50 year or more project to make it work.
