I am very strongly apposed to the banning of fossil fuel automobiles. For starters, our electric grid could not support it . Secondly, the production & disposal of lithium batteries are more harmful to the environment than fossil fuel's. If anything, why not focus on hydrogen power instead of pushing the electric cars ! Electric car batteries take far too long to charge & not conducive to average family needs ! Not to mention the cost of replacement of the batteries once they have expired! Areas of California are already experiencing electricity shortage, so where does this lead ? Can you imagine what problems they and many other cities would face if every household owned just one electric car ? Do people realize how many things we use every day that are derived from fossil fuel's? No , banning fossil fuel's IS NOT THE ANSWER!
