

Brad Sieloff

California says something like all cars will be electric, and then asks residents not to charge their cars, as the power grid won't handle it. That's with a low percentage of the population using electric vehicles. Are we going to start damming up rivers again? Every open area filled with solar panels or wind turbines? Power has got to come from somewhere. The infrastructure is not there, nor is it going to be any time soon. There is also going to be environmental issues stemming from that and the production of the batteries. Trading one problem for another one...is not a plan.
