

Claudia Olson

Washington State and our entire United States is not ready to have total electric cars, trucks & boats. All delivery trucks can't go far enough on a charge. Our country is the cleanest in the world with our energy (natural gas, hydro power, coal & oil. We were energy independent which keeps our Country and many other countries around the world safe. Wind mills have killed more raptors (eagles, osprey, hawks, owls) than anything else. Plus windmills are toxic & there is no place to dispose of them. Operating them in the ocean wreaks havoc with sea mammals sonar (dolphins, whales etc). Solar panels also use toxic materials & there is no place to dispose of them. They also kill thousands of birds every year. We will have huge areas of toxic unusable land wherever we dump these so called "environmental energy materials". Electric cars are too expensive & take too long to charge to make them usable for distance driving for delivery of all our goods. Charging stations need energy to use them. Where do you intend to get that energy from? Windmills & solar panels combined are useless & can't produce enough energy to power all these machines for farming, planes, trucks, boats, & cars. Wake up & realize that electric transportation is not ready for the entire country yet!
