

## BRIAN SHAPUTIS

Setting these bans on gas-powered vehicles seems insanely premature. Not one state in this country has the infrastructure set up to support this influx of EV's... In fact California, the front-runner of this insanity, actually told people to turn off their air conditioners during a period of record heat this summer because they feared the grid was overwhelmed... but they want everyone in an electric car that has to charge daily. This seems like a huge contradiction. All of these policies seem to be the classic "Putting the cart before the horse" scenario... We should be working on improving our hybrid technology and continue working on upgrading the grid BEFORE trying to force everyone into EV's...
