

Sean Hogan

I have been in the solar and geothermal business for over 40 years in Washington, an environmentalist well before it was popular or a movement. This however is a trainwreck in search of a date, not thought through unless the goal is to cripple our economy and accelerate rolling brown and blackouts along with insane electrical cost.

I'm all for electrification, it makes a great deal of sense, but our infrastructure is not capable of such load shifting. BPA sells a good deal of our hydroelectric power to other states which ties our hands on capacity. Power transmission lines are at capacity already and you want to "legislate or Mandate" such as this fool's errand without a well thought out and executed infrastructure buildout. Please, don't implement this crazy fuel plan and internal combustion engine elimination, it will hurt our entire state and do very little for the environment. This from a guy whose entire career has been centered around renewable energy!
