

## Paul Bond

There are 250 million gasoline powered cars in the U.S. Many are collector cars, muscle cars, 4WD vehicles, and cars that people aren't going to want to part with, nor will be able to afford to. How dare you people force this on us, considering current gas prices, the economy, and your complete lack of a solid plan. Will all of you follow suit, or expect it of us, while still flying in your private jets and your own collector, or classic gasoline powered cars? EV cars also require many materials to be mined from the ground. What about the wildlife in those areas? Do you people care about anything other than what YOU want?
