

## Dezri Dean

Neither the electric vehicles nor the power grid are ready for this.

There are still major problems with electric vehicles, the fact that they are not less polluting than gasoline vehicles if measured from inception to end of life is included and then we have the scarcity of the raw minerals needed to build them and their ever increasing prices. Have you taken into account what it costs an individual to go electric over gas, most people can't afford a new car let alone the cost of an electric vehicle all of which cost more than a comparable gas vehicle. Just say NO until all of these problems are worked out.
