Once again, the powers that be have their heads in the sand, you want to ban gas powered vehicles so you look good on preventing green house gases, that is fine but think about what you are doing first. Unfortunately, you do need fossil fuels, sad but true, you have no apparent plan for charging stations, that need to be put almost everywhere until EV's can go more than 300 miles per charge, EV batteries need a lot of time to re-charge, what happens when a storm knocks out your power grid. Think before you go crazy with your plan, I cannot afford an EV, nor can 99% of your electorate.
