

Vivek Swamatha

The total carbon footprint (mining of rare Earth metals, refining the ore, transportation and production) exceeds that of their gasoline counterpart. Moreover, the electric grid does not have the capacity to charge BEV's. Look into renewable gasoline, which is a drop in. Also, most people can not afford EV's especially recent immigrants. This 2035 policy is racists and not equitable. You think inflation is bad now, wait for 2035.
