

## Eric Stelter

As a former Tesla owner I can tell you that electric cars are good only under a narrow set of circumstances— adequate infrastructure, storage and generation of power. Our state has none of these, and I am pretty involved in working on mobility and transportation issues. there is no plan for that infrastructure. Besides, when ALL impacts (ie mineral mining and disposal) are considered, electric vehicles are no better and are quite possibly worse than gas powered cars. solar and wind power demand huge batteries to be able to charge vehicles as well. This rule makes no practical sense and should not be adopted. This is written as though the adoption is a foregone conclusion, which is idiotic.
