

Stephen Gildea

This is absolutely undoable. The cost of these cars is out of most people's reach. The cost to the environment to produce one battery or to dispose of the spent battery is outrageous. The cost to replace batteries is absolutely insane. Finding a place to recharge is rarely available for most people. A grid that will handle a large amount of recharging is non-existent. To make all of this happen is cost-prohibitive. Gasoline-powered vehicles must remain available for many years to come.
