

## Robin Johansen

I would like to submit my objection to the adoption of the California motor vehicle emission standards for the state of Washington. This will do very, very little to affect the world temperature and will cost the average citizen so much money to install and maintain charging stations. The time that it will take to charge an EV will cause a long line up of vehicles, plus there is not one standard for charging vehicles. I can fill up my vehicle with gas in about 3 to 4 minutes, while charging an EV takes 30 minutes to several hours. The price of EV's is beyond the reach of most people. This will also put extreme pressure on the electrical grid, they are already telling people to not charge their EV's in the evening during summer months and I'm sure this will cause brown outs in many places. BAD IDEA!!!
