

## Alexander Mihal

this is a closed minded approach, we are spending billions of dollars on something that may or may not work. Has science looked at other possibilities for climate change, instead of focusing on pollution as the only cause. It seems like things got alot worse with the use of cell phones and other electronic wireless devices in the last 20 years. These devices transmit billions of signals everyday through the atmosphere and they create friction and friction creates heat, Has science studied this and what is their conclusion. Maybe climate change is a natural occurrence and there is nothing we can do about it. Washington state was covered with glaciers before there was pollution and the climate turned warmer and melted the glaciers, humans had nothing to do with this warm up. Taxing people will not stop climate change, it will only make it harder for them to pay bills and create more homeless people, then we will have more problem, I think the best solution to climate change would be weather modification like cloud seeding or using newer Tecnologies to control the weather. Operation Popeye was used in the Vietnan war with great succus. China used these technology's Durning the summer Olympics and it rained and washed all the pollution away If we focus all our time and money on just one thing causing climate change we might be to late. In other words look at the bigger picture and come up with other solutions if you truly want to combat climate change before it to late. Thank you for your time in this matter
