

Ertan Serince

There are many projects with chillers using high GWP (above 750) and these projects have issued/approved building permits. This creates an issue when you consider the production lead times for chillers. Contractors and owners can't proceed with their approved projects because the chillers may not be manufactured on time (before January 1, 2024).

For Stationary Air-Conditioning Equipment, there is an exemption: -1-facilities with new air conditioning equipment when there is an approved building permit issued before the effective date of the final rule-1-.

This exemption should also apply to chillers to solve this issue.
