What additional information should be included about spending that is formally supported by a Tribal resolution?

This feels like a question best answered by tribal governments.

How should Ecology determine which projects are required to report their GHG emissions reductions?

Acquisition and restoration services should not be required for green GHG emission reductions. If they are, simple formulas should be created to help agencies report these.

What should Ecology consider when determining how to evaluate greenhouse gas emissions reductions from projects?

Many projects already collect metrics that measure environmental services/benefits. Allowing agencies to utilize current metrics that could also lend to emission reduction measurements would reduce redundancies and administrative burden.
