Re: The Safer Products for Washington Priority Consumer Products Draft Report to
Legislature (Jan. 2020; Publication 20-04-004)

To whom it may concern:

Mohawk Industries, Inc. (Mohawk) submits these comments to the State of Washington Department of Ecology (Ecology) on Ecology's Priority Consumer Products Draft Report to Legislature (Draft Report), submitted as part of the Safer Products for Washington (SPW) program. We appreciate the opportunity to comment on this important initiative.

Mohawk manufactures vinyl flooring for the residential and commercial market. Mohawk is a member of the Resilient Floor Covering Institute (RFCI), an association representing the interests of the resilient floor covering industry. We support and hereby incorporate by reference the comments on the Draft Report submitted by RFCI on March 2, 2020.

As explained in more detail in the comments submitted by RFCI, a significant body of evidence demonstrates that exposure to phthalates (specifically, ortho-phthalates) in vinyl flooring (to the extent such chemicals may be present in those products) presents minimal to non-existent risk to health or safety. Concerns of health risks associated with exposure to phthalate-containing vinyl flooring are therefore misguided, as are (admittedly well-intentioned) administrative efforts to restrict those products. However, Ecology representatives have made clear, including during the February 19, 2020 public webinar regarding the Draft Report, that in implementing the SPW Program Ecology is not considering any hazard or risk information related to the products it is considering for designation as priority products. We therefore submit these comments to provide additional information regarding the dramatic reduction in use of ortho-phthalates in the manufacture of vinyl flooring by manufacturers of vinyl flooring, including Mohawk.

As discussed in RFCI's comments, vinyl flooring manufacturers have already moved away from the use of ortho-phthalates towards alternatives, including terephthalates (which, as explained in further detail in RFCI's comments, are structurally very different from the ortho-phthalates that

drive the listing of “phthalates” as a priority chemical class under the SPW program). This transition was in part due to public pressure related to the “Mind the Store” campaign, whereby the largest home improvement retail chains in the United States (Home Depot, Lowes, and Menards) and others adopted policies to phase out ortho-phthalate-containing PVC flooring by the end of 2015.¹ Because of these retail store policies, the vast majority of vinyl flooring sold in the state of Washington (and throughout the United States) is now manufactured without ortho-phthalates.² The experience of Mohawk supports this industry trend. In our case, Mohawk stopped using ortho-phthalates in our vinyl flooring products in 2015.

Our voluntary, proactive shift towards the use of alternatives to ortho-phthalates is evidence of the wider trend within the vinyl flooring industry and demonstrates Mohawk’s continued commitment to the production of safe, sustainable products—and responding to public concerns regarding perceived risk even where data demonstrate risk is minimal to non-existent. Mohawk appreciates Ecology’s goals in developing and implementing the SPW program and we are happy to provide additional information if that would be useful to Ecology as it works to finalize its list of priority products.

Thank you for the opportunity to provide this information in connection with this important regulatory initiative.

Sincerely,

Bill Welch
