**Subject:** Will you strengthen the PFAS Chemical Action Plan (CAP)?

**THIS EMAIL ORIGINATED FROM OUTSIDE THE WASHINGTON STATE EMAIL SYSTEM - Take caution not to open attachments or links unless you know the sender AND were expecting the attachment or the link**

Dear Hazardous Waste and Toxics Reduction Program,

Good afternoon,

Today, I am emailing to ask Department of Ecology to take stronger and swifter action on toxic per- and polyfluoroalkyl substances (PFAS). While many of the actions proposed in Department of Ecology's draft Chemical Action Plan (CAP) move our state in the right direction, this draft falls short of necessary steps to protect WA residents from toxic forever chemicals.

The PFAS CAP represents a significant opportunity for Washington to demonstrate leadership and create a model for other states and the nation, just as it has done on toxic pollution issues for more than a decade. Turning off the tap on PFAS is especially important as we confront COVID-19: among the most alarming impacts of PFAS contamination are its weakening effect on our immune systems and links to chronic diseases that make people more vulnerable to COVID-19.

My feedback is that Ecology strengthen the PFAS CAP to include the following recommendations:

- (1) Stronger water standards ASAP - Adopt strong drinking water standards in 2021 for all PFAS and expand testing to identify Washington drinking water systems contaminated with PFAS.
- (2) Identify safer alternatives and ban uses of PFAS no later than 2025. Ecology should immediately declare apparel (including firefighter personal protective equipment), cleaning products, floor waxes and stone/wood sealers, and personal care products as priority products so that the search for safer alternatives begins now and bans can be put in place no later than 2025.
- (3) Immediately designate the entire class of PFAS chemicals as hazardous substances under the Model Toxics Control Act (MTCA); adopt cleanup standards for all PFAS in 2021; and subject PFAS to the hazardous substance tax.
- (4) Speed up timelines for dealing with PFAS contamination. An ambitious timeline must be established to identify and clean up toxic sites beginning in 2021.
- (5) Pursue immediate testing of sludge (biosolids) and develop standards for all PFAS. Sludge from municipal treatment plants should be tested for PFAS chemicals, together with farms where sludge has been applied, and alternatives for sludge disposal should be pursued.
- (6) Ensure safe disposal of PFAS-containing products. Washington state should prohibit the burning of PFAS solid and hazardous wastes and pursue the safest storage or disposal options.

Thank you for your consideration.

Sincerely,  
Maja Persson
