

Larry McCarter

Biosolids is the one product, of all PFAS containing products that is spread Willy Nilly without monitoring or supervision. I have never seen any PFAS monitoring or testing data from any of the Land Application sites. Ecology does not have many (if any) records of testing Land Applications sites for PFAS or loading. Ecology needs to address this issue. Biosolids industry have you all somehow ignoring this obvious exposure pathway. The demand to Beneficially Use sewage sludges is a case of recycling gone awry. The cost per ton of recovered nutrients is reflected in the huge WWTP's expenses to "handle" the sludges and those costs are absurd when lined-landfilling the very smallest fraction of sludges would cure the problem and save our waterways.
