When the Waste Treatment Plant (OUG 10) was added to the Hanford Dangerous Waste Permit in 2002, Ecology stated that the interim compliance schedule was established to provide Ecology with design documentation needed for construction to proceed. Ecology explained that the design drawings would be removed from the permit when an operating permit was issued. The Low Activity Waste Facility, Laboratory Facility, and the Effluent Management Facility all have operating permits under the current 8C permit. Appendices 9, 11, and 13 should be reviewed to remove design information not critical for facility operations. The level of design documentation in the permit should be consistent among the Part III units.
