

Steven Smith

Thank you. Steven Smith from Philips 66. First, thank you for this webinar and I think the much more detailed discussion of the process about assessment, and particularly lifecycle assessment.

I wanted to maybe echo an earlier comment made by another speaker around how I think perhaps examples could be, I think, particularly informative as we move forward in this rulemaking. And I think that an example, perhaps that would encompass both assessment and mitigation, which is I know the topic of the next workshop, could be useful. So, maybe that would be a productive use of time in the next workshop.

And an example, something, and I'll just give you one that pops to head. Let's say, an example of something like a vehicle manufacturer in a global economy, where half of the vehicle's components are produced in Mexico, and the balance of the vehicle components in final assembly is in Washington state.

And then of that vehicle half the vehicles were sent and used in Washington and the other half were sent and used, let's say, overseas. And so there, I think, mitigation questions come to mind, so I just might suggest that, I think that could further this conversation along quicker.

And maybe, maybe very productively to think about pros and cons in different lifecycles assessments in real world situations like that. Thank you.
