

Jeanne Poirier

The most important way to control GHG assessment is to just simply not allow any new fossil fuel infrastructure to be built! The entirety of the project and lifespan would be next. By this I mean is it on water? Is on Native land? Is it a pipeline from another state or country? Is the end use strictly economic benefit - and for who. I am very much against Tacoma LNG project being pushed by PSE and the Kalama Methanol Refinery being pushed by NWIW - there are others, but I'll end this comment for now.
