While I support solar as an energy source the risks of lithium battery storage in our area seem problematic due to proximity to clean water and soil intended to grow food. What is the clearance from these zones? Once it's gone it's GONE. I think it's safe to say a spill WILL happen so what is the safety protocol...? We have volunteer run fire departments-will they be trained to help? There is a lot of tribal land, the residents there should have a say in these BESS locations. The whole thing makes me rather nervous. I was in CA during the Moss Landing incident-very scary! Please keep human health in the forefront of your decision making. In addition as a component, perhaps we can address using LESS energy in general: lights out at night as a strong message to our surrounding cities & will also lend to our migratory and resident bird population, something this area is well known for.
