Kirsten Wei

I would like to reiterate the environmental damage that results from BESS anywhere. Look no further than the 3 recent fires that burned at Moss Landing in Monterrey for weeks,the environmental damage and continued monitoring that provides the evidence of widespread chemical arrays in the air and soil. Most recently, beginning of Sept. Summerville in Prince Rupert Islands Canada, burned all month and finally has been contained. Once burned, these facilities are more prone to repeated ignition. These fires can't be put out,pose a threat to firefighters and humans. Recently had to evacuate residents for days due to City Water or Sewage Utility battery fire in the area East Utah or Virginia? Is it worth the trade off of our pristine rural areas putting children and schools at risk for a Texas Company that could care less about the environmental damage done in the green state of Washington for a few kilowatts of power while lining the pockets of investors? This is greenwashing at best. It's time to reassess climate action requirements and incentives before our natural resources are destroyed! Ditto on the covert plan of Data Centers being built and the damage done to the residents, water use, energy required to run them and noise decibals all in the name of national security!
