K Schneider

The Ecology study should define "suitable" areas using safety as a guide. Will it be too close to underground water or rivers that could be contaminated if there were a fire, are there adequate resources (personnel, water) immediately available to extinguish any potential fire, if near populated areas are there sufficient exit routes to quickly and safely evacuate the population, what is the safety record of the batteries and the installer / operator, any possibility of any potential fire spreading into forested area, and what would happen in the event of a major earthquake are a few things I feel need to be considered.
