Robert Boivin

I have two issues associated with this project, the technology chosen for storage, lithium batteries and location. Lithium batteries are known to catch on fire and difficult to extinguish plus emit toxic fumes. This leads to the second issue, proximity to community. The location chosen is near a forest and residential housing with an area that has high winds. The proximity to housing limits the time for people to evacuate combined with limited egress routes. There are other ecological issues also with contamination of waterways etc. In preparing criteria I believe that the technology should be safe and location near populated areas excluded based on proposed battery type.
