Jeff Walker

As a resident of Snoqualmie, I implore you to not approve the building and installation of the BESSProject. There are multiple examples of the dangers associated with these facilities. The risks of harm to the health of our community members, which includes children and families, is way to significant. Secondarily, and certainly of noteworthy concern, is the damage it would do to the desirability of our community, and thus the significant drop in property values. And then, of course, there are the environmental issues. A quick scan of the media shows many examples of communities needing to either evacuate or shelter in place due to the severely harmful effects when these things catch fire. And again, a media scanning will show that happens way too often. This should absolutely not be installed so close to homes, schools and the broader community. Let's find a place where it is not close to people and community members. I encourage you to ask yourself if you would allow to be installed close to your own home.
