

Karen Van Bruggen

Please do not allow garbage contaminated with food to be put into landfills. Methane is an incredibly big reason why we have climate change, and one of the best ways to produce less methane is to stop food waste and stop putting food scraps into our landfills.

I was intrigued to learn of a highly successful campaign in Ohio where people are encouraged to stop sending food to the landfill. (Check it out online. For example, here is a website that helps the average Ohio citizen do a better job in managing their food supply: <https://savemorethanfood.org/>) WA state desperately needs to do what Ohio did, and that is educate our citizens about how to keep uneaten food out of the garbage.

Frankly, it is unconscionable that we would even consider allowing a company to dispose of organic matter tainted by microplastics into our environment, and then let the rest of the organic matter rot and turn into methane at the landfill.
