

Peter Joseph

Investigation work has been ongoing at this site for the last couple months. Just this week, subsurface work is being conducted adjacent to a daycare. While vapor intrusion is a serious concern for chlorinated solvent cleanup sites, the daycare represents a potential exposure pathway for high risk receptors. Will Ecology provide results to the vapor intrusion assessment to the public in a timely manner?

If the vapor assessment is only provided following completion of the remedial investigation, which could take substantial amount of time to complete, there could be unwarranted exposure of toxic chemicals to children and their caregivers.
