

Debra Gronning

I live near Finch arboretum but have property with a well about five miles south of I-90. I understand that the aquifer flows North to Northeast but that doesn't necessarily mean that the wells South of I-90 are unaffected. If we find that wells South of I-90 have also been contaminated, then I would advocate for biological clean-up as described in the link included in Faith Moeser's comment <https://e360.yale.edu/digest/bacteria-break-down-pfas-forever-chemicals>. Since biological solutions can take time I would also want the Federal government to remedy the situation by hooking all those impacted up to city water at government expense. I know city waterlines are less than a mile from my well. Lastly, we must consider the impact that PFAS has already had on our long term health from drinking the contaminated water for years and how will folks be compensated for that?
