

John Huffstetler

In the current proposal, there is no current cost analysis of the threat of sea-level rise and/or tsunami on the planned soil cap. What happens if sea level rises above the cap? What happens if a tsunami big enough crashes in the cap? Your own documentation admits that caps only work if they are not eroded, and these events could seriously damage and erode the cap. And these risks are not hypotheticals. Sea level rise and a large tsunami triggered by earthquakes from the Juan de Fuca plate are real threats that WA communities have been planning for for years. I support plan SL-5; full removal of soil and no cap. Please don't try to save a few bucks now only to end up with a costly cap disaster in the future.
