I have used the garden springs fill site to fill camping jugs provided by Spokane .

I cannot grasp how this can be considered a safe ,clean fill site . The hose appears to be just garden hose grade hanging from a water spigot on side of the building . The hose is not long enough to fill my jugs in my vehicle so I have to set them on ground which is coverd with dirt , gravel , leaves ,cut grass much less the wildlife that likely drink and migrate to the puddle of water from spills . Spills are not just from jug filling , but from large water construction tankers as they get full and splash on concrete pad lying right next to small fill hose . The hose must be wiped down with antibacterial cleaning on exterior as how is a person to trust wher that construction truck has been and what splashed off . What about the interior ?

I do not consider this a clean environment ,to fill from and unsafe with large trucks filling less than 4' away and is unsafe for many other reasons much less freezing ice conditions when cold temps occur .

I would compare this fill setup to camping at the lake , not something for daily drinking water use

....

Drinking Water deliverd to affected residents is a much safer environment and jugs are sealed and sanitized each time .
