

August Freeman

To Whom It May Concern,

This project is a great opportunity to accomplish many things that will benefit the public, our nation, and our world. Pumped storage is one part of the many pronged attack that will be necessary for humanity to curb climate change. Green power production itself can reduce carbon emissions, but can only do so much, whereas pumped storage adds the flexibility to ensure reliability without the use of expensive and resource sapping batteries.

A project like this moves the needle in the right direction and will continue to reap environmental, reliability, and cost benefits for many decades to come.

Thank You,

August Freeman
